

# C Reference slides

# [ String Operations ]

- strcpy
- strlen
- strcat
- strcmp

# [ strcpy, strlen ]

- `strcpy(ptr1, ptr2);`
  - `ptr1` and `ptr2` are pointers to char
- `value = strlen(ptr);`
  - `value` is an integer
  - `ptr` is a pointer to char

```
int len;  
char str[15];  
strcpy (str, "Hello,  
world!");  
len = strlen(str);
```

[strcpy, strlen]

- What's wrong with

```
char str[5];  
strcpy (str, "Hello");
```

# [ strncpy ]

- `strncpy(ptr1, ptr2, num);`
  - `ptr1` and `ptr2` are pointers to char
  - `num` is the number of characters to be copied

```
int len;  
char str1[15],  
      str2[15];  
strcpy (str1,  
        "Hello, world!");  
strncpy (str2, str1,  
        5);
```

# [ strncpy ]

- `strncpy(ptr1, ptr2, num);`
  - `ptr1` and `ptr2` are pointers to char
  - `num` is the number of characters to be copied

```
int len;  
char str1[15],  
      str2[15];  
strcpy (str1,  
        "Hello, world!");  
strncpy (str2, str1,  
        5);
```

Caution: `strncpy` blindly copies the characters. It does not voluntarily append the string-terminating null character.

# [ strcat ]

- `strcat(ptr1, ptr2);`
  - `ptr1` and `ptr2` are pointers to char
- Concatenates the two null terminated strings yielding one string (pointed to by `ptr1`).

```
char S[25] = "world!";  
char D[25] = "Hello, ";  
strcat(D, S);
```

# [ strcat ]

- `strcat(ptr1, ptr2);`
  - `ptr1` and `ptr2` are pointers to char
- Concatenates the two null terminated strings yielding one string (pointed to by `ptr1`).
  - Find the end of the destination string
  - Append the source string to the end of the destination string
  - Add a NULL to new destination string

# [ strcat Example ]

- What's wrong with

```
char S[25] = "world!";  
strcat("Hello, ", S);
```

# [ strcat Example ]

- What's wrong with

```
char *s = malloc(11 * sizeof(char));
        /* Allocate enough memory for an
           array of 11 characters, enough
           to store a 10-char long string. */
strcat(s, "Hello");
strcat(s, "World");
```

# [ strcat ]

- `strcat(ptr1, ptr2);`
  - `ptr1` and `ptr2` are pointers to char
- Compare to Java and C++
  - `string s = s + " World!";`
- What would you get in C?
  - If you did `char* ptr0 = ptr1+ptr2;`
  - You would get the sum of two memory locations!

# [ strcmp ]

- `diff = strcmp(ptr1, ptr2);`
  - `diff` is an integer
  - `ptr1` and `ptr2` are pointers to char
- Returns
  - zero if strings are identical
  - $< 0$  if `ptr1` is less than `ptr2` (earlier in a dictionary)
  - $> 0$  if `ptr1` is greater than `ptr2` (later in a dictionary)

```
int diff;
char s1[25] = "pat";
char s2[25] = "pet";
diff = strcmp(s1, s2);
```

Other operations

# [ Increment & decrement ]

- `x++`: yield old value, add one
- `++x`: add one, yield new value

```
int x = 10;
```

```
x++;
```

```
int y = x++;
```

11

```
int z = ++x;
```

13

- `--x` and `x--` are similar (subtract one)

# Math: Increment and Decrement Operators

- Example 1:

```
int x, y, z, w;  
y=10; w=2;  
x=++y;  
z=--w;
```

- Example 2:

```
int x, y, z, w;  
y=10; w=2;  
x=y++;  
z=w--;
```

What are **x** and **y** at the end of each example?

# Math: Increment and Decrement Operators on Pointers

- Example 1:

```
int a[2];  
int number1, number2, *p;  
a[0]=1; a[1]=10;  
p=a;  
number1 = *p++;  
number2 = *p;
```

- What will `number1` and `number2` be at the end?

# Math: Increment and Decrement Operators on Pointers

- Example

```
int a[2];  
int number1, number2, *p;  
a[0]=1; a[1]=10;  
p=a;  
number1 = *p++;  
number2 = *p;
```

← Hint: ++ increments pointer **p** not variable **\*p**

- What will `number1` and `number2` be at the end?

# Logic: Relational (Condition) Operators

==	equal to
!=	not equal to
>	greater than
<	less than
>=	greater than or equal to
<=	less than or equal to

Review

# [Review

---

- `int p1;`

What does `&p1` mean?

# [ Review ]

- How much is `y` at the end?

```
int y, x, *p;
```

```
x = 20;
```

```
*p = 10;
```

```
y = x + *p;
```

# [Review]

- What are the differences between `x` and `y`?

```
char* f() {  
    char *x;  
    static char*y;  
    return y;  
}
```

# [ Review: Debugging ]

```
if (strcmp ("a", "a"))  
    printf ("same!");
```

# [ Review: Debugging ]

```
int i = 4;  
int *iptr;  
iptr = &i;  
*iptr = 5; //now i=5
```

# [ Review: Debugging ]

```
char *p;  
p=(char*)malloc(99);  
strcpy("Hello",p);  
printf("%s World",p);  
free(p);
```

# [ Review: Debugging ]

```
char msg[5];  
strcpy (msg, "Hello");
```

Operator	Description	Associativity
() [] . -> ++ --	Parentheses (function call) Brackets (array subscript) Member selection via object name Member selection via pointer Postfix increment/decrement	left-to-right
++ -- + - ! ~ (type) * & sizeof	Prefix increment/decrement Unary plus/minus Logical negation/bitwise complement Cast (change type) Dereference Address Determine size in bytes	right-to-left
* / %	Multiplication/division/modulus	left-to-right
+ -	Addition/subtraction	left-to-right
<< >>	Bitwise shift left, Bitwise shift right	left-to-right
< <= > >=	Relational less than/less than or equal to Relational greater than/greater than or equal to	left-to-right
== !=	Relational is equal to/is not equal to	left-to-right
&	Bitwise AND	left-to-right
^	Bitwise exclusive OR	left-to-right
	Bitwise inclusive OR	left-to-right
&&	Logical AND	left-to-right
	Logical OR	left-to-right
?:	Ternary conditional	right-to-left
= += -= *= /= %= &= ^=  = <<= >>=	Assignment Addition/subtraction assignment Multiplication/division assignment Modulus/bitwise AND assignment Bitwise exclusive/inclusive OR assignment Bitwise shift left/right assignment	right-to-left
,	Comma (separate expressions)	left-to-right

# C No Evil

A practitioner's guide

# [ Playing with fire ]

---

- Program arguments
- Output
- Stack memory

# [ ARGCount ARGValues ]

```
int main(argc, char** argv)
```

```
int main(argc, char* argv[])
```

## ■ argc

- Argument count
- The number of arguments that are passed to `main` in the argument vector `argv`.
- the value of `argc` is always one greater than the number of command-line arguments that the user enters.

# [ ARGCount ARGValues ]

```
int main(argc, char** argv)
```

```
int main(argc, char* argv[])
```

- `argv`

- argument vector
- An array of string pointers passed to a C program's `main` function
- `argv[0]` is always the name of the command
- `argv[argc]` is a null pointer

# [ ARGCount ARGValues ]

What is `argc`?

# [ Type questions ]

- `char **argv;`

What type is `argv`?

What type is `*argv`?

What type is `**argv`?

# [Review]

- `main(int argc, char**argv) {`  
what is `*argv`?  
what is `argv[argc]`?

# [ printf Format Identifiers ]

<code>%d</code> or <code>%i</code>	Decimal signed integer
<code>%o</code>	Octal integer
<code>%x</code> or <code>%X</code>	Hex integer
<code>%u</code>	Unsigned integer
<code>%c</code>	Character
<code>%s</code>	String
<code>%f</code> or <code>%g</code>	Double
<code>%p</code>	Pointer

All of the parameters should be the value to be inserted  
EXCEPT `%s`, this expects a pointer to be passed

# [ printf Basic Data Types ]

```
#include <stdio.h> // for printf
int main(int argc, char *argv[]) {

    // print "the date is: 01/25/2010",
    // i.e. 2- or 4-digit with leading zeros
    // using 32-bit 'long' datatype
    long day = 25;
    long month = 1;
    long year = 2010;
    printf("the date is: %02ld/%02ld/%04ld\n", month, day, year);

    // - print 8-digit hex value
    // - print a pointer value
    unsigned long ulID = 0x12345678;
    unsigned long *pID = &ulID;
    printf("hex value: 0x%02lX at address: %p\n", ulID, pID);
}
```

# [ printf Basic Data Types ]

```
// - print 4 bytes of a 32-bit ulong value
// as separate hex values
unsigned char uc1 = (unsigned char) (ulID >> 24);
unsigned char uc2 = (unsigned char) (ulID >> 16);
unsigned char uc3 = (unsigned char) (ulID >> 8);
unsigned char uc4 = (unsigned char) (ulID >> 0);
printf("hex bytes: %02X %02X %02X %02X\n", uc1, uc2, uc3, uc4);

// - print double value like "70.35000"
double dTemp = 70.35;
printf("temperature: %5.5f\n", dTemp);
}
```

# [ printf Escape Sequences ]

<code>\a</code>	<bell>	<code>\'</code>	<single quote>
<code>\b</code>	<backspace>	<code>\"</code>	<double quote>
<code>\e</code>	<escape>	<code>\?</code>	<question mark>
<code>\f</code>	<form-feed>	<code>\\</code>	<backslash>
<code>\n</code>	<new-line>	<code>\num</code>	an 8-bit character with ASCII value of the 1-, 2-, or 3-digit octal number num.
<code>\r</code>	<carriage return>		
<code>\t</code>	<tab>		
<code>\v</code>	<vertical tab>		
<code>\0</code>	<null>	<code>%%</code>	<percent>

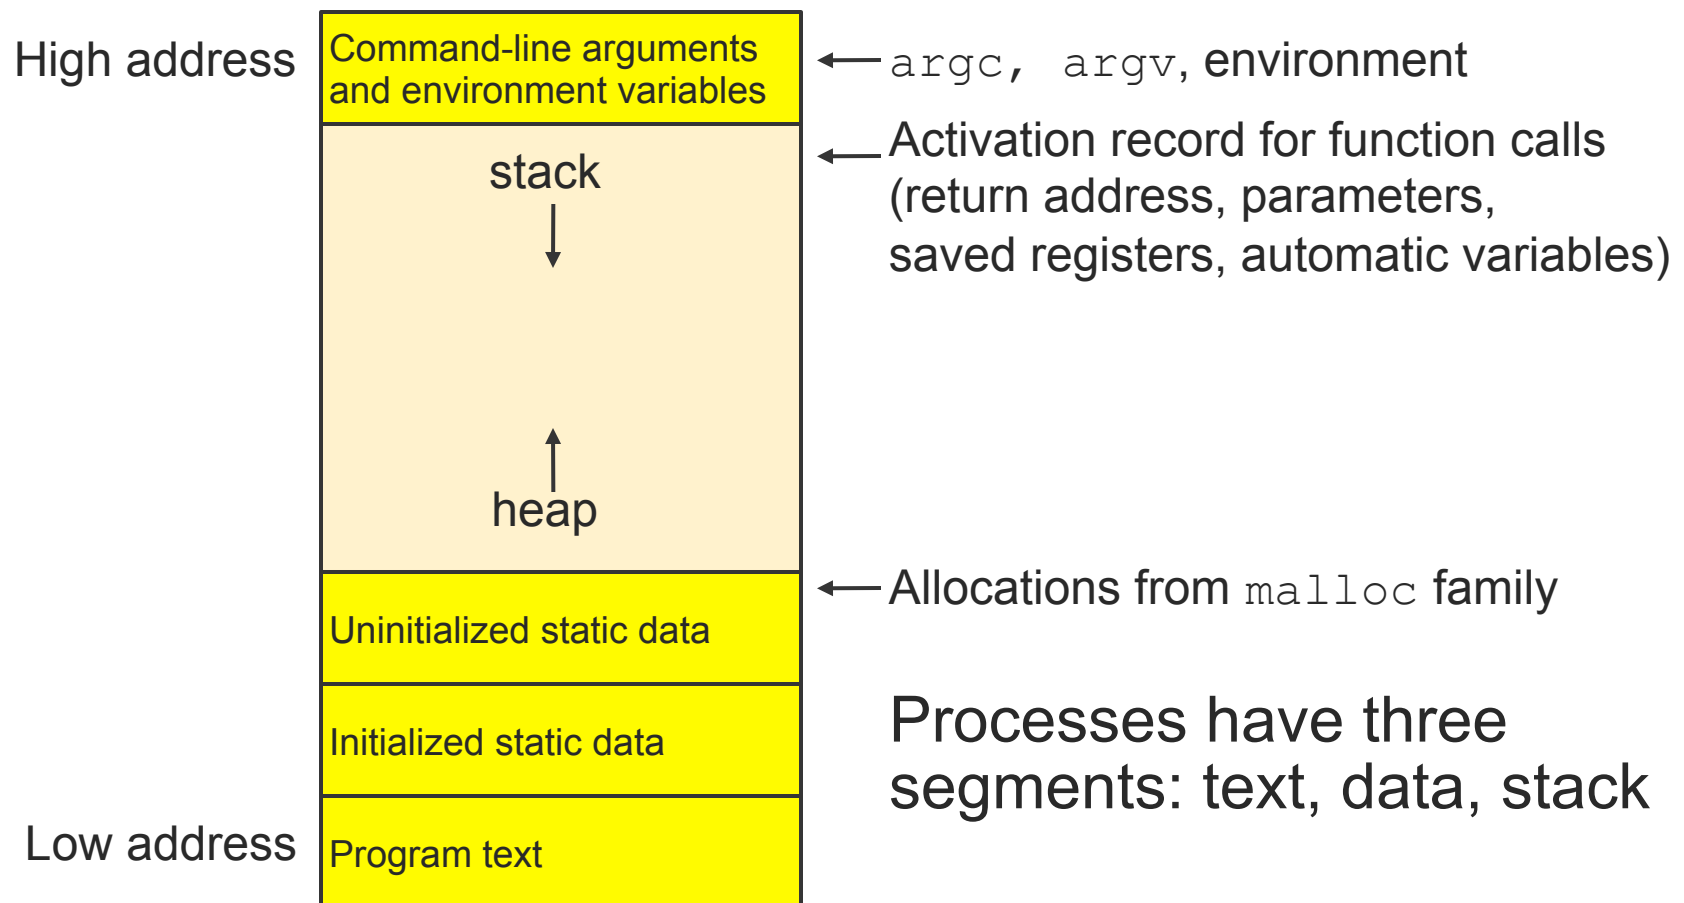

# [ Common Pitfall ]

---

- Returning a variable in stack memory from a function
  - What is stack memory?

# Sample layout for program image in main memory

# [ Example ]

```
int b() {  
    /* ... */  
}
```

```
int a() {  
    /* ... */  
    b();  
}
```

```
int main(int argc,  
char **argv) {  
    /* ... */  
    a();  
}
```

At the beginning of the program, the OS creates a stack frame for `main()`

Stack Memory:

# [ Example ]

```
int b() {  
    /* ... */  
}
```

```
int a() {  
    /* ... */  
    b();  
}
```

```
int main(int argc,  
char **argv) {  
    /* ... */  
    a();  
}
```

When `a()` is called, the OS creates a new stack frame for `a()`

Stack Memory:

# [ Example ]

→ int b() {  
    /\* ... \*/  
}

→ int a() {  
    /\* ... \*/  
    b();  
}

→ int main(int argc,  
    char \*\*argv) {  
    /\* ... \*/  
    a();  
}

Same for b () ...

Stack Memory:

# [ Example ]

```
int b() {  
    /* ... */  
}
```

```
int a() {  
    /* ... */  
    b();  
}
```

```
int main(int argc,  
char **argv) {  
    /* ... */  
    a();  
}
```

When `b()` finishes running, its stack frame is removed!

What happens to the memory?

Stack Memory:

# [ Example ]

```
int b() {  
    /* ... */  
}
```

```
int a() {  
    /* ... */  
    b();  
}
```

```
int main(int argc,  
char **argv) {  
    /* ... */  
    a();  
}
```

When `b()` finishes running, its stack frame is removed!

What happens to the memory?

Stack Memory:

# [ Example ]

And so on ...

```
int b() {  
    /* ... */  
}
```

```
int a() {  
    /* ... */  
    b();  
}
```

```
int main(int argc,  
char **argv) {  
    /* ... */  
    a();  
}
```

Stack Memory:

# [ Example ]

And so on ...

```
int b() {  
    /* ... */  
}
```

```
int a() {  
    /* ... */  
    b();  
}
```

```
int main(int argc,  
char **argv) {  
    /* ... */  
    a();  
}
```

## So What?

Stack Memory:

# Better Example

```
my_queue * b() {  
    my_queue q;  
    return &q;  
}
```

```
int a(int yourVal) {  
    int myVal;  
    my_queue *myQueue;  
    myVal = yourVal + 3;  
    myQueue = b();  
    return  
        remove_int(myQueue);  
}
```

```
int main(int argc,  
         char **argv) {  
    int myVal = 3;  
    a(myVal);  
}
```

**main() still calls a()**  
**a() still calls b()**  
**b() returns a pointer to a()**  
**a() returns an int to main()**  
**my\_queue is a custom struct**

# [ Better Example ]

```
my_queue * b() {  
    my_queue q;  
    return &q;  
}
```

```
int main(int argc,  
        char **argv) {  
    int myVal = 3;  
    a(myVal);  
}
```

```
int a(int yourVal) {  
    int myVal;  
    my_queue *myQueue;  
    myVal = yourVal + 3;  
    myQueue = b();  
    return  
        remove_int(myQueue);  
}
```

# [ Better Example ]

```
my_queue * b() {  
    my_queue q;  
    return &q;  
}
```

```
int main(int argc,  
         char **argv) {  
    int myVal = 3;  
    a(myVal);  
}
```

```
int a(int yourVal) {  
    int myVal;  
    my_queue *myQueue;  
    myVal = yourVal + 3;  
    myQueue = b();  
    return  
        remove_int(myQueue);  
}
```

myVal (4 bytes)	3
**argv (8 bytes)	0x...
argc (4 bytes)	1

# Better Example

```
my_queue * b() {  
    my_queue q;  
    return &q;  
}
```

```
int main(int argc,  
         char **argv) {  
    int myVal = 3;  
    a(myVal);  
}
```

```
int a(int yourVal) {  
    int myVal;  
    my_queue *myQueue;  
    myVal = yourVal + 3;  
    myQueue = b();  
    return  
        remove_int(myQueue);  
}
```

yourVal (4 bytes)	3
myVal (4 bytes)	3
**argv (8 bytes)	0x...
argc (4 bytes)	1

# [ Better Example ]

```
my_queue * b() {  
    my_queue q;  
    return &q;  
}
```

```
int main(int argc,  
         char **argv) {  
    int myVal = 3;  
    a(myVal);  
}
```

```
int a(int yourVal) {  
    int myVal;  
    my_queue *myQueue;  
    myVal = yourVal + 3;  
    myQueue = b();  
    return  
        remove_int(myQueue);  
}
```

myVal (4 bytes)	???????
yourVal (4 bytes)	3
myVal (4 bytes)	3
**argv (8 bytes)	0x...
argc (4 bytes)	1

# [ Better Example ]

```
my_queue * b() {  
    my_queue q;  
    return &q;  
}
```

```
int main(int argc,  
char **argv) {  
    int myVal = 3;  
    a(myVal);  
}
```

```
int a(int yourVal) {  
    int myVal;  
    my_queue *myQueue;  
    myVal = yourVal + 3;  
    myQueue = b();  
    return  
        remove_int(myQueue);  
}
```

# [ Better Example ]

```
my_queue * b() {
    my_queue q;
    return &q;
}
```

```
int main(int argc,
char **argv) {
    int myVal = 3;
    a(myVal);
}
```

```
int a(int yourVal) {
    int myVal;
    my_queue *myQueue;
    myVal = yourVal + 3;
    myQueue = b();
    return
        remove_int(myQueue);
}
```

# [ Better Example ]

```
my_queue * b() {
    my_queue q;
    return &q;
}

int a(int yourVal) {
    int myVal;
    my_queue *myQueue;
    myVal = yourVal + 3;
    myQueue = b();
    return
        remove_int(myQueue);
}
```

# [ Better Example ]

```

my_queue * b() {
    my_queue q;
    return &q;
}

int a(int yourVal) {
    int myVal;
    my_queue *myQueue;
    myVal = yourVal + 3;
    myQueue = b();
    return
        remove_int(myQueue);
}

```

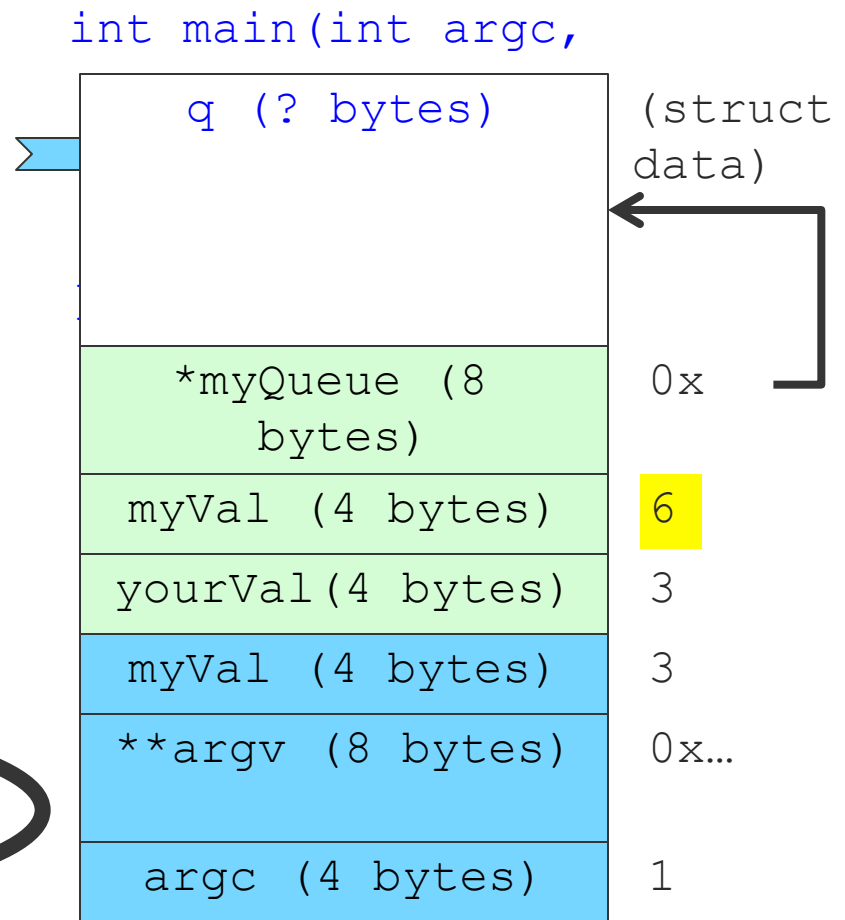

# [ Better Example ]

```

my_queue * b() {
    my_queue q;
    return &q;
}

int a(int yourVal) {
    int myVal;
    my_queue *myQueue;
    myVal = yourVal + 3;
    myQueue = b();
    return
    remove_int(myQueue);
}

```

# [ Use your stack wisely ]

- Returning a pointer to a stack variable results in unpredictable behavior
- Three ‘common’ fixes
  - Good: Pass in a pointer to the variable you want to use
  - Good: Use a heap variable
  - Very Bad (usually): Use a global variable
